NAPHTHALENE DERIVATIVESBackground of the Invention

The present invention relates to naphthalene derivatives, to processes and intermediates for their preparation, to pharmaceutical compositions containing them and to their medicinal use. The compounds of the present invention are selective agonists and antagonists of serotonin 1 (5-HT<sub>1</sub>) receptors and as such are useful in treating migraine and other disorders for which a 5-HT<sub>1</sub> agonist or antagonist is indicated.

European patent application 434,561-A describes 7-alkyl, alkoxy, and hydroxy substituted-1-(4-substituted-1-piperazinyl)-naphthalenes. The compounds are claimed to be 5-HT<sub>1</sub> agonists and antagonists useful for the treatment of migraine, depression, anxiety, schizophrenia, stress and pain. However, EP 434,561-A neither discloses nor suggests the type of 7-substituted 1-(1-piperazinyl)-naphthalenes provided by the present invention.

European patent application 343,050-A1 describes 7-unsubstituted, halogenated, and methoxy substituted-1-(4-substituted-1-piperazinyl)-naphthalenes as 5-HT<sub>1A</sub> ligands useful in therapy. However, EP 343,050-A1 neither discloses nor suggests the type of 7-substituted 1-(1-piperazinyl)-naphthalenes provided by the present invention.

Drug Res. Dev., 1991, 22, 25 describes 7-methoxy-1-(1-piperazinyl)-naphthalene as a 5-HT<sub>1</sub> ligand. This publication neither discloses nor suggests the type of 7-substituted 1-(1-piperazinyl)-naphthalenes provided by the present invention.

Thus ligands with high affinity for the 5-HT<sub>1</sub> receptors are well recognized as having therapeutic value for the treatment of human conditions caused by serotonin imbalance.

Summary of the Invention

7-(Benzimidazol-1-yl)-1-(4-methylpiperazin-1-yl)naphthalene; and  
8-(1-Methylpiperidin-4-yl)naphthalene-2-carboxylic acid 4-chlorobenzylamide.

Other compounds believed to be most preferred are the following:

- 10 1-{7-[3-(4-Chloro-benzyl)-[1,2,4]oxadiazol-5-yl]-naphthalen-1-yl}-4-methyl-  
piperazine;  
4-{7-[3-(4-Chloro-benzyl)-[1,2,4]oxadiazol-5-yl]-naphthalen-1-yl}-1-methyl-  
piperidine;  
7-(3-Methoxyphenyl)-1-(1-methylpiperidin-4-yl)-naphthalene; and  
15 7-(4-Methoxyphenyl)-1-(1-methylpiperidin-4-yl)-naphthalene.

The present invention also relates to a pharmaceutical composition for treating  
a condition selected from hypertension, depression, anxiety, eating disorders, obesity,  
drug abuse, cluster headache, migraine, pain, Alzheimer's disease, and chronic  
paroxysmal hemicrania and headache associated with vascular disorders comprising

#### Detailed Description of the Invention

10

Compounds of formula I of this invention where R<sup>1</sup> is of the formula II are prepared by the following reaction of an  $\alpha$ -tetralone of formula V with a suitable piperazine of formula VI.

-8/1-

10

25

The so called enamines of formula VII are generally prepared by this reaction in the presence of an acid catalyst such as, for example, p-toluenesulfonic acid or titanium tetrachloride. If desired, the water formed as a by-product of the reaction may be effectively removed from the reaction as it is formed by the use of a reagent such as

molecular sieves or calcium sulfate, or by azeotropic removal employing a Dean Stark trap with a refluxing solvent. The reaction is typically run in a reaction inert solvent such as benzene, toluene, tetrahydrofuran, or methylene chloride, at a temperature of from about -78°C to about 150°C. When titanium tetrachloride is used as the acid catalyst, the preferred temperature for the reaction is from about -78°C to about 25°C. When azeotropic water separation is employed, the preferred reaction temperature is the boiling temperature of the particular reaction solvent.

In general, the  $\alpha$  tetralones of formula V, for example, where  $R_2$  is -OH, -NO<sub>2</sub>, or -NH<sub>2</sub>, are known in the literature and can be readily prepared by those skilled in the art, such as, for example 7-amino- $\alpha$ -tetralone, (J. Med. Chem., 1976, 19, 472) and 7-hydroxy- $\alpha$ -tetralone, (Tetrahedron Lett., 1981, 22, 603). Other  $\alpha$  tetralones of formula V are readily prepared using the alkylation, acylation, and organometallic reactions described herein and in standard synthesis texts, for example Organic Synthesis, Wiley, New York). The piperazines of formula VI are commercially available or can be made using methods known in the art.

The enamines of formula VII may be converted to compounds of formula I by an oxidative process. The reaction may be carried out using a variety of methods known in the art. Among the acceptable oxidizing agents are noble metal catalysts, such as, palladium or platinum on activated carbon if desired, chloranil, and sulfur. The reactions can be carried out in a reaction inert solvent for example, toluene, xylene, tetrahydrofuran, methylene chloride, preferably toluene or xylene, however a solvent is not always necessary, especially for oxidations carried out with elemental sulfur. The oxidation reactions generally proceed at a temperature of about 0°C to about 250°C. Preferred temperatures for the oxidation depend on the particular oxidant in use and are about 60°C to about 150°C for noble metal catalytic oxidation, about 150°C to about 250°C for sulfur oxidation and about 0°C to about 100°C for chloranil oxidations. From 1 to 5 equivalents, preferably 2-4 equivalents, of an additive such as dicyclopentadiene or [2,2,2] bicyclooctene may be added to the reaction to reduce the amounts of enamine reduction side products which may form competitively with the desired naphthalene product.

Additional compounds of formula I may also be formed using standard chemical transformations on other compounds of formula I. For example, when  $R_2$  is  $R_4(C=O)NH-$  or  $R_4(C=O)O-$ , these groups may be hydrolyzed in the presence of

aqueous acid or base to form  $\text{-NH}_2$  and  $\text{-OH}$  groups, respectively. These standard hydrolysis reactions may be carried out in water with any of a variety of acids or bases (for example  $\text{HCl}$ ,  $\text{HBr}$ ,  $\text{NaOH}$ , or  $\text{KOH}$ , preferably acid for amide hydrolysis and base for ester hydrolysis) and a cosolvent (methanol or tetrahydrofuran, for example) may be used if desired to promote dissolution of I in the medium. The reaction may be carried out at a temperature of from about  $0^\circ\text{C}$  to about  $150^\circ\text{C}$ . The preferred reaction temperature is about  $20^\circ\text{C}$  to about  $40^\circ\text{C}$  for basic hydrolysis and about the boiling temperature of the mixture for acidic hydrolysis.

Additional compounds of formula I may be prepared by a reaction using an alkylating or acylating agent (alkyl halide, mesylate, triflate, etc., or arylalkyl halide, mesylate, triflate, etc., or an alkyl or aryl anhydride, or an alkyl or aryl carboxylic acid chloride, etc.) with compounds of formula I where  $\text{R}_2 = \text{-NH}_2$  or  $\text{-OH}$ . Suitable alkylating agents could include compounds of the formulae  $\text{R}_4\text{-(CH}_2)_b\text{-Y}$  or  $\text{R}_5\text{-(CH}_2)_b\text{-Y}$  where  $b$  is 0 to 3 and  $\text{Y}$  is a suitable leaving group, such as, for example,  $\text{Br}$ ,  $\text{I}$ , or triflate. Suitable acylating agents could include acid chlorides (e.g.  $\text{R}_4\text{-(CH}_2)_b\text{-(C=O)-Cl}$  or  $\text{R}_5\text{-(CH}_2)_b\text{-(C=O)-Cl}$ ) or acid anhydrides (e.g.  $(\text{R}_4\text{-(CH}_2)_b\text{-(C=O)})_2\text{-O}$  or  $(\text{R}_5\text{-(CH}_2)_b\text{-(C=O)})_2\text{-O}$ , where  $b$  is 0 to 3). The reaction may be carried out in a reaction inert solvent such as tetrahydrofuran and dichloroethane for the alkylating and acylating reactions. Preferred solvents depend on the solubility of the reagents and the selection thereof would be known to one skilled in the art. These alkylation or acylation reactions are carried out at temperatures of between about  $0^\circ\text{C}$  to about  $200^\circ\text{C}$  depending on the nature of the reaction. Preferred temperatures are between about  $0^\circ\text{C}$  to about  $75^\circ\text{C}$  for the acylation reactions and between about  $25^\circ\text{C}$  to about  $100^\circ\text{C}$  for the alkylation reactions.

-11-

Additional compounds of formula I may be prepared by the well known reductive alkylation reaction of the compounds of formula I where  $R_2$  is  $-NH_2$  with aldehydes and ketones in the presence of hydrogen gas and a platinum or palladium catalyst or in the presence of a reducing agent such as sodium cyanoborohydride.

- 5        Other compounds of formula I can be synthesized using an activated aromatic or heterocyclic compound, which are either commercially available or can be produced using methods known in the art. To form the additional compounds, these reactants are reacted with compounds of formula I where  $R_2$  is OH or  $NH_2$ . As shown below, the term activated aromatic or heterocyclic compound implies a ring compound of formulae

where Y is a suitable leaving group (for example halogen or trifluoromethanesulfonyloxy) and the ring is rendered susceptible to nucleophilic attack by the presence of one or more nitrogen atoms in the ring or by the presence of one or more electron withdrawing groups (in other words one or more of R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub>, R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, or R<sub>14</sub> are halogen, -CF<sub>3</sub>, nitro, cyano, alkoxycarbonyl, amidocarbonyl, etc.) attached to the ring. Values for A, B, D, E, F, G, I, J, K, and R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub>, R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, and R<sub>14</sub> may be selected from those described previously. Solvents suitable for use with the activated aromatic or heterocyclic compounds include, for example, dimethylformamide, N-methylpyrrolidinone, or methylene chloride and a base (for example triethylamine, 4-dimethylaminopyridine, sodium or potassium carbonate,

sodium hydride) may be used to facilitate the process if desired. Preferred solvents depend on the solubility of the reagents and the selection thereof would be known to one skilled in the art. These alkylation or acylation reactions are carried out at temperatures of between about 0°C to about 200°C depending on the nature of the reaction. Preferred temperatures are between about 50°C to about 125°C for these reactions.

The alkylation and acylation procedures described above can also be useful in synthesizing of intermediates of formula V.

Compounds of formula I where  $R_2$  is one of the claimed alkyl, alkenyl, or alkynyl moieties can be prepared by reaction of compounds of formula I where  $R_2$  is  $CF_3SO_3^-$  with an appropriate olefin or acetylene compound in the presence of a palladium catalyst. The selection of appropriate olefin or acetylene depends on the alkyl, alkenyl, or alkynyl moiety desired in the end product, as would be appreciated by one skilled in the art. The alkenyl and alkynyl substituted compounds can be produced using the following reaction scheme:

-12/1-

The catalyst may be selected from those typically employed for the so-called Heck reaction (palladium acetate, palladium chloride, bis (acetonitrile) palladium chloride, for example). The reaction is carried out neat or in a reaction inert solvent such as acetonitrile, dimethylformamide, or N-methylpyrrolidinone. The reaction is conveniently run at 20°C to 160°C, preferably 60°C to 130°C. The details of reactions of this type have been well described in the literature (Organic Reactions 1982, 27, 345).

The synthesis of compounds having the claimed alkyl moieties require the additional step of reducing the product of the reaction discussed in the previous paragraph. The reduction is performed using standard methods known in the art.

The Heck reaction can also be useful in the synthesis of intermediates of formula V, as is known in the art.

The compounds of formulae I and intermediates of formula V where  $R_2$  is  $CF_3SO_3$  can be prepared by reacting the corresponding  $R_2$  substituted hydroxy

compounds of formulae I or V with an activated form of triflic acid, for example, triflic anhydride, acid chloride, N-phenyltrifluoromethanesulfonimide, preferably triflic anhydride, typically in the presence of a base, such as, for example, triethylamine or diisopropylethylamine, preferably triethylamine. The reaction may be run in an inert solvent, such as, tetrahydrofuran or methylene chloride, at a temperature of from about -78°C to about 25°C, preferably below about 0°C. This procedure is known in the art, as shown, for example, in J. Amer. Chem. Soc., 1987, 109, 5478.

A method to prepare the compounds of formula I where  $R_2$  is  $R_4$  or  $R_4(CH_2)_b(C=O)(CH_2)_c-$  is accomplished by reacting compounds of formula I where  $R_2$  is trimethylstannyl or tributylstannyl with an aryl or vinyl halide, or an aryl or vinyl triflate, or an aryl or alkyl acid chloride or a heteroaryl halide or triflate in the presence of a catalyst, preferably tetrakis(triphenylphosphine)palladium or tris(dibenzylideneacetone)dipalladium, and is shown in the following reaction scheme:

The procedures and conditions to carry out this reaction are known to those in the art, for example, in Angew. Chem. Int. Ed. Engl., 1986, 25, 508. The triflate variant of this reaction is also known in the art, for example, in J. Amer. Chem. Soc., 1987, 109, 5478. A further variation of this type of process which uses an alkyl or aryl halide in the presence of carbon monoxide gas and a palladium catalyst is also known, for example, in J. Amer. Chem. Soc., 1988, 110, 1557.

-13/1-

It will be recognized by one skilled in the art that the coupling reactions described above may also be used to prepare the intermediates of formula V.

The stannane compounds I and V may be prepared from the compound I ( $R_2$  being  $CF_3SO_3$ ) following known literature procedures (J. Amer. Chem. Soc., 1987, 109, 5478).

A method to prepare compounds of formula I where  $R_2$  is  $R_4$  is accomplished by reacting compounds of formula I where  $R_2$  is bromo, iodo, or  $-OSO_2CF_3$  with an arylstannane, arylboronic acid, heteroaryl boronic acid, or heteroarylstannane in the presence of a catalyst, preferably tetrakis(triphenylphosphine)palladium, in an inert solvent, and is shown in the following scheme:

15

The procedures and conditions to carry out this reaction are known to those skilled in the art, for example, in *Angew. Chem. Int. Ed. Engl.*, 1986, 25, 508. The triflate variant of this reaction is also known in the art, for example, in *J. Am. Chem. Soc.*, 1987, 109, 5478. The required arylstannanes or heteroarylstannanes are available by methods known to one skilled in the art, for example, in *J. Am. Chem. Soc.*, 1987, 109, 5478. The procedure and conditions for boronic acid couplings are described in *J. Org. Chem.* 1993, 58, 2208.

A method of preparing compounds of formula I and intermediates of formula V where  $\text{R}_2$  is  $-\text{O}-\text{R}_4$  is to react corresponding compounds of formula I or intermediates of formula V where  $\text{R}_2$  is  $-\text{OH}$  with alcohols, for example, ethanol or benzyl alcohol, in the presence of triphenylphosphine and diethyl azodicarboxylate in a Mitsunobu reaction. Mitsunobu reactions are known in the art, for example, as disclosed in *Synthesis* 1981, 1.

30 Further compounds of formula 1 where  $\text{R}_2$  is  $\text{R}_4-(\text{CH}_2)_b-\text{O}-(\text{C}=\text{O})-(\text{CH}_2)_c-$  or  $\text{R}_4(\text{CH}_2)_b-\text{NH}-(\text{C}=\text{X})-(\text{CH}_2)_c-$  and  $c$  is 0 may be prepared by reaction of compounds of the formula I where  $\text{R}_2$  is  $\text{OSO}_2\text{CF}_3$  with an alcohol or an amine and carbon monoxide in the presence of a palladium catalyst. Hydrolysis of the resulting esters or amides to

-14/1-

the corresponding acids and treatment following the general procedures outlined in EP 0 438 230 A2 further allow the preparation of additional compounds of formula I where  $R_2$  is  $-R_4$  and  $R_4$  is of formula XVI [e.g., a (1,2,4-oxadiazol-5-yl)-naphthalene].

- 5           Compounds of formula I may also be prepared using standard functional group manipulations known in the art and which are disclosed in various standard synthetic chemistry texts. Examples of these are discussed below.

When  $R_2$  is  $R_4(CH_2)_b(C=O)(CH_2)_c-$ , it may be reacted with a reducing agent, to yield the corresponding alcohol. Standard methods known in the art can be used.

- 10   Useful reducing agents include sodium borohydride, lithium aluminum hydride, or borane (or any of its complexes).

Compounds of formula I where the  $R_2$  substituent includes a ketone or ester carbonyl moiety may be treated with organometallic agents, such as alkyl- and aryl lithiums, or Grignard reagents using methods known in the art. In this reaction, the resulting compounds will be tertiary alcohols ( $R_2 = -C(OH)R_4R_5$ ).

- 5        When  $R_2$  contains an amide group, treatment with a reducing agent, such as, for example, lithium aluminum hydride or borane using known methods, produces the corresponding alkylated (or aralkylated) secondary or tertiary amines.

- 10       Another example of the interconversion of compounds of formula I is the reduction of a nitro group of an  $R_2$  substituent including a nitrophenyl or nitropyridyl group to the corresponding amine. For example, as shown below,

15

- where  $R_1$  and Z are as defined above, the reaction may be carried out using known nitro group reducing agents and methods, for example, hydrogenation over noble metal catalysts (palladium or platinum on a support, such as carbon, if desired) or by  
20       dissolving metal reduction.

In a further example of the interconversion of the compounds of formula I, the product of the previous reaction scheme may be cyclized with, for example, dimethylformamide dimethyl acetal or triethyl orthoformate to produce fused imidazole compounds of formula I, as shown below,

-15/1-

or DMF-acetal

or diethyl

malonate, or  
ethoxymethylene-

15

The reaction may be carried out in an inert solvent, such as, for example, dimethylformamide, ethanol, or dimethyl sulfoxide, preferably dimethylformamide. The reaction is run at a temperature of from about 20 °C to about 125°C. If desired, an acid catalyst, such as, p-toluenesulfonic acid or camphor sulfonic acid, preferably p-toluenesulfonic acid, may also be used to facilitate the reaction. In some cases the

amidine compounds of formula I can be isolated, especially when the acid catalyst is not used.

Another method to carry out the reaction shown in the previous scheme employs diethyl ethoxymethylenemalonate, ethoxymethylenemalononitrile, or related reagents preferably ethoxymethylenemalononitrile, as the cyclization reagent. This reaction may be run in an inert solvent, such as, acetic acid, ethanol, or isopropanol, preferably isopropanol or acetic acid. The reaction temperature should be from about 25°C to about 150°C. The preferred temperature is the reflux temperature of the solvent for convenience and to decrease the reaction time.

Compounds of formula I where  $R_1$  is tetrahydropyridine, piperidine, or azacycloalkylmethyl may be prepared from 8-bromo- $\beta$ -tetralone, which is known in the art, for example in U.S. Patent No. 4,897,405, as shown in the following reaction scheme:

15

-16/1-

-16/2-

The 8-bromo- $\beta$ -tetralone is first reacted with an amine, for example, dibenzylamine to form an enamine X using the same procedure disclosed previously on page 8. The enamine X can be dehydrogenated as described above on page 9, 5 chloranil being the preferred reagent with these particular reactants, to yield 1-bromo-7-amine substituted naphthalenes XI. Selection of an appropriate amine for the enamine-forming step would be apparent to one skilled in the art, for example, diallylamine and dibenzylamines for instance. Compounds XI can be then treated with vinylstannanes, for example, 1-BOC-4-trimethylstannyl-1,2,5,6-tetrahydropyridine (BOC=tert-

butyloxycarbonyl), shown in the above scheme, in the presence of a catalyst. Palladium is the preferred catalyst, for example  $(\text{Ph}_3\text{P})_4\text{Pd}$  or  $\text{Pd}_2(\text{dba})_3$  and the reaction follows the same procedures as described above on pages 12 to 14, where  $\text{R}_1$  is tetrahydropyridine in a so-called Stille and Heck reactions.

5       Compounds of formula I where  $\text{R}_1$  is piperidine can be prepared by catalytic hydrogenation of the tetrahydropyridine from the previous paragraph, using standard methods known in the art, generally with palladium on carbon as the catalyst.

Compounds I where  $\text{R}_1$  is piperidine or tetrahydropyridine can be produced, for example, by removal of the benzyl groups (when  $\text{R}_2$  is dibenzylamino) by catalytic  
10   hydrogenolysis, using a suitable catalyst such as palladium hydroxide, palladium on carbon, or platinum on carbon, preferably palladium hydroxide. The reaction is performed in an inert solvent, such as ethanol or ethyl acetate, either with or without a protic acid, such as acetic acid or HCl. The preferred acid is acetic acid. In this case, the resulting compounds are of formula I where  $\text{R}_2$  is amino. The amino group  
15   can be derivatized using standard techniques known in the art and as described previously on pages 10 to 16 to afford further compounds of formula I with substituted amines.

Compounds of formula XI from the previous reaction scheme may also be treated with alkyllithium reagents, for example, butyllithium, sec-butyllithium or tert-  
20   butyllithium, preferably butyllithium in an inert solvent, as shown below,

-17/1-

5

i.  $R_1$  = Formula III OR IV

30

Suitable solvents include, for example, ether or tetrahydrofuran, preferably tetrahydrofuran. Reaction temperatures range from about  $-110^{\circ}\text{C}$  to about  $0^{\circ}\text{C}$ . The intermediate lithium anions of formula XII thus formed may then be further reacted with a suitable electrophile, selection of which depends on the desired substituent at the  $R_1$

-18-

position. Suitable electrophiles to prepare compounds I where  $R_1$  is formula III or IV include, for example, carbonyl derivatives or alkylating agents (e.g., 1-BOC-4-piperidone, 1-BOC-prolinal or 1-FMOC-2-chloromethylpyrrolidine (FMOC=fluorenylmethoxycarbonyl)).

- 5 In the case where an aldehyde or ketone is used as the electrophile, the intermediates XIII, XIV, or XX which are formed require that the hydroxy group be removed so as to result in compounds of formula I as shown below,

-18/1-

This step may be accomplished by one of several standard methods known in the art. For example, a thiocarbonyl derivative (for example a xanthate) may be prepared and removed by a free radical process, both of which are known to those skilled in the art. Alternatively, the hydroxyl group may be removed by reduction with

5

a hydride source such as triethylsilane under acidic conditions, using such as, for example, trifluoroacetic acid or boron trifluoride. The reduction reaction can be performed neat or in a solvent, such as methylene chloride. A further alternative would be to first convert the hydroxyl group to a suitable leaving group, such as tosylate or chloride, using standard methods. The leaving group is then removed with a nucleophilic hydride, such as, for example, lithium aluminum hydride. This last reaction is performed typically in an inert solvent, such as, ether or tetrahydrofuran. Also, a reducing agent may be used to reductively remove of the benzylic substituent. Suitable reducing agents include, for example, Raney nickel in ethanol, or sodium or lithium in liquid ammonia. Another alternative method for removing the hydroxyl group is to first dehydrate the alcohol XIII, XIV, or XX to an olefin with a reagent such as Burgess salt (J. Org. Chem., 1973, 38, 26) followed by catalytic hydrogenation of the double bond under standard conditions with a catalyst such as palladium on carbon. The alcohol may also be dehydrated to the olefin by treatment with acid such as p-toluenesulfonic acid. For XIII the free radical procedure is preferred because it preserves the stereochemical integrity of the chiral center. For XIV or XX the Burgess salt or acid dehydration procedures are preferred.

In the case where  $R_2$  is, for example, dibenzylamino, additional compounds of formula I may be prepared by hydrogenolysis and derivatization as described above on pages 10 to 16.

8-bromo- $\beta$ -tetralone, discussed earlier, may also be utilized to form other compounds of formula I, as shown below,

-19/1-

 and unsubstituted)

8-bromo- $\beta$ -tetralone is first dehydrogenated to form 1-bromo-7-hydroxynaphthalene using an oxidizing reagent, such as, for example, elemental sulfur as described above on page 8 or N-bromosuccinimide. An appropriate protecting group is then used to protect the hydroxyl group if desired, formation and selection  
5 being within the knowledge of one skilled in the art (e.g., Greene and Wuts, Protective Groups in Organic Synthesis, 2nd edition, Wiley, New York, 1991). This is followed by subsequent replacement of the bromo substituent using methods described previously on pages 16 to 18. After replacement of the bromo substituent, the hydroxyl protecting  
10 group may be removed using standard chemistry, and the free hydroxyl group may be derivatized as described above on pages 10 to 14 to afford compounds of formula I wherein  $R_2$  is attached to the naphthalene ring via a carbon or oxygen atom. In some cases the protecting group may also serve as an activating group for further transformations,  $CF_3SO_3$ , for example, as described earlier on pages 12 to 14 or may simply be the final  $R_2$  moiety.

15 Unless indicated otherwise, the pressure of each of the above reactions is not critical. Generally, the reactions will be conducted at a pressure of about one to about three atmospheres, preferably at ambient pressure (about one atmosphere).

The compounds of the formula I which are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids.  
20 Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to initially isolate a compound of the formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent, and subsequently convert the free base to a pharmaceutically acceptable acid addition salt.  
25 The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent such as methanol or ethanol. Upon careful evaporation of the solvent, the desired solid salt is obtained.

30 The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate or bisulfate, phosphate or

acid phosphate, acetate, lactate, citrate or acid citrate, tartrate or bitartrate, succinate, maleate, fumarate, gluconate, saccharate, benzoate, methanesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)] salts.

Those compounds of the formula I which are also acidic in nature, e.g., where  
5  $R_2$  contains a carboxylate, are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline-earth metal salts and particular, the sodium and potassium salts. These salts are all prepared by conventional techniques. The chemical bases which are used as reagents to prepare the pharmaceutically acceptable base salts of this invention are  
10 those which form non-toxic base salts with the herein described acidic compounds of formula I. These non-toxic base salts include those derived from such pharmacologically acceptable cations as sodium, potassium, calcium and magnesium, etc. These salts can easily be prepared by treating the corresponding acidic compounds with an aqueous solution containing the desired pharmacologically  
15 acceptable cations, and then evaporating the resulting solution to dryness, preferably under reduced pressure. Alternatively, they may also be prepared by mixing lower alkanolic solutions of the acidic compounds and the desired alkali metal alkoxide together, and then evaporating the resulting solution to dryness in the same manner as before. In either case, stoichiometric quantities of reagents are preferably employed  
20 in order to ensure completeness of reaction of maximum product of yields of the desired final product.

The compounds of the formula I and the pharmaceutically acceptable salts thereof (hereinafter, also referred to as the active compounds of the invention) are useful psychotherapeutics and are potent serotonin (5-HT<sub>1</sub>) agonists and antagonists  
25 and may be used in the treatment of depression, anxiety, eating disorders, obesity, drug abuse, cluster headache, migraine, chronic paroxysmal hemicrania and headache associated with vascular disorders, pain, and other disorders arising from deficient serotonergic neurotransmission such as Alzheimer's disease. The compounds can also be used as centrally acting antihypertensives and vasodilators.

30 The affinities of the compounds of this invention for the various serotonin 1 receptors are evaluated using standard radioligand binding assays as described in the literature. The 5-HT<sub>1A</sub> affinity is measured using the procedure of Hoyer et al. (Brain Res., 1986, 376, 85). The 5-HT<sub>1C</sub> affinity is measured using the procedure of Pazos et

-22-

al. (Eur. J. Pharmacol., 1985, 106, 539). The 5-HT<sub>1D</sub> affinity is measured using the procedure of Heuring and Peroutka (J. Neurosci., 1987, 7, 894).

The compositions of the present invention may be formulated in a conventional manner using one or more pharmaceutically acceptable carriers. Thus, the active compounds of the invention may be formulated for oral, buccal, intranasal, parenteral  
5 (e.g., intravenous, intramuscular or subcutaneous) or rectal administration or in a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycolate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well  
10 known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, methyl cellulose or hydrogenated  
15 edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters or ethyl alcohol); and preservatives (e.g. methyl or propyl p-hydroxybenzoates or sorbic acid).

For buccal administration the composition may take the form of tablets or lozenges formulated in conventional manner.

25 The active compounds of the invention may be formulated for parenteral administration by injection, including using conventional catheterization techniques or infusion. Formulations for injection may be presented in unit dosage form, e.g. in ampules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous  
30 vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form for reconstitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

The active compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

For intranasal administration or administration by inhalation, the active compounds of the invention are conveniently delivered in the form of a solution or suspension from a pump spray container that is squeezed or pumped by the patient or as an aerosol spray presentation from a pressurized container or a nebulizer, with the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurized container or nebulizer may contain a solution or suspension of the active compound. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated containing a powder mix of a compound of the invention and a suitable powder base such as lactose or starch.

A proposed dose of the active compounds of the invention for oral, parenteral or buccal administration to the average adult human for the treatment of the conditions referred to above (e.g., migraine) is 0.1 to 200 mg of the active ingredient per unit dose which could be administered, for example, 1 to 4 times per day.

Aerosol formulations for treatment of the conditions referred to above (e.g., migraine) in the average adult human are preferably arranged so that each metered dose or "puff" of aerosol contains 20 $\mu$ g to 1000 $\mu$ g of the compound of the invention. The overall daily dose with an aerosol will be within the range 100 $\mu$ g to 10 mg. Administration may be several times daily, for example 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

The following Examples illustrate the preparation of the compounds of the present invention. Melting points are uncorrected. NMR data are reported in parts per million ( $\delta$ ) and are referenced to the deuterium lock signal from the sample solvent (deuteriochloroform unless otherwise specified). Specific rotations were measured at room temperature using the sodium D line (589 nm). Commercial reagents were utilized without further purification. THF refers to tetrahydrofuran. DMF refers to dimethylformamide. Chromatography refers to column chromatography performed using 32-63  $\mu$ m silica gel and executed under nitrogen pressure (flash chromatography) conditions. Room or ambient temperature refers to 20-25°C. All non-aqueous

Example 577-Amino-1-(1-methyl-4-piperidiny)-naphthalene

The following reaction was run in two side by side reactions and the crude products were combined for work up and purification. A mechanically stirred solution of 8-bromo-2-(dibenzylamino)-naphthalene (10.0 g, 24.9 mmol from Preparation 4) in tetrahydrofuran (200 mL) was cooled to -95°C (hexane/liquid nitrogen) and butyllithium (10.39 mL, 24.9 mmol, 2.4 M) was added dropwise. The orange solution was stirred 7 min, then 1-methyl-4-piperidone (2.82 g, 24.9 mmol) was added dropwise over 10 minutes with a 10 mL tetrahydrofuran rinse. The orange color faded while stirring was continued 20 minutes at -100°C. The reaction was allowed to warm to room temperature and quenched with water. The solvent was removed and the residue was partitioned between methylene chloride and water (at this point the two reactions were combined). The phases were separated and the organic layer was washed with brine, dried, and concentrated onto silica gel. Flash chromatography (4 x 4 inches silica gel) proceeded as follows: methylene chloride (1 L) and 2% methanol / methylene chloride (1.6 L) unweighed white solid 7-dibenzylaminonaphthalene; 15% methanol / methylene chloride (1 L), 25% methanol / methylene chloride (1 L) and 30% methanol / methylene chloride / 0.2% ammonium hydroxide (4 L) product contaminated with water. The combined eluents were concentrated and redissolved in methylene chloride. The solution was dried and concentrated to afford 15.09 g (69%) of 7-dibenzylamino-1-(4-hydroxy-1-methyl-4-piperidiny)-naphthalene as a light tan foam. A sample recrystallized from ethyl acetate had mp 173-174°C. Analysis calculated for  $C_{30}H_{32}N_2O$ : C, 82.53; H, 7.39; N, 6.42. Found: C, 82.42; H, 7.44; N, 6.38.

The product from the above reaction (15.0 g, 34.38 mmol), p-toluenesulfonic acid (7.85 g, 41.26 mmol) and toluene (500 mL) were combined and refluxed 4 hours with azeotropic removal of water. The mixture was allowed to stand at room temperature 48 hours, then additional p-toluenesulfonic acid (1.4 g) was added and the mixture was refluxed 5 hours more. The reaction was concentrated at reduced pressure and the residue was taken up in methylene chloride. This organic phase was washed with 1 N sodium hydroxide (2 x) and brine, then it was dried over calcium sulfate and concentrated to give 7-dibenzylamino-1-(1-methyl-1,2,5,6-tetrahydropyrid-4-yl)-naphthalene as a brown oil which crystallized on standing (13.8 g, 96%). This material was suitable for use in the next reaction. A sample recrystallized from ethyl

#### 7-Trifluoromethylsulfonyloxy-1-(4-methyl-1-piperazinyl)-naphthalene

- 7-Hydroxy-1-(4-methyl-1-piperazinyl)-naphthalene (4.1 g, 16.9 mmol) and triethylamine (12.8 mL, 91.8 mmol) were dissolved in methylene chloride (150 mL) and cooled to -78°C. Triflic anhydride (3.04 mL, 18.1 mmol) was added via syringe and the reaction was warmed to room temperature and stirred overnight. The reaction was again chilled to -78°C and additional triflic anhydride (1 mL) and triethylamine (2 mL) were added but after 2 hours stirring at ambient temperature, no further reaction occurred. Saturated ammonium chloride was added and the mixture was concentrated. The residue was partitioned between ethyl acetate and water. The organic layer was washed with water and brine, dried over magnesium sulfate and concentrated to a brown oil which was purified by silica gel flash chromatography (2 x 6 inches). Elution with 75% ethyl acetate/hexane gave 4.49 g (71%) of the title product as a light brown solid: mp 70-71°C. Analysis calculated for C<sub>18</sub>H<sub>17</sub>F<sub>3</sub>N<sub>2</sub>O<sub>3</sub>S: C, 51.33; H, 4.58; N, 7.48. Found: C, 51.35; H, 4.46; N, 7.49.

#### 7-Benzamido-1-(4-methyl-1-piperazinyl)-naphthalene

- 7-Benzamido-1-(4-methyl-1-piperazinyl)-3,4-dihydronaphthalene (0.795 g, 2.29 mmol, an intermediate from Example 1), freshly distilled dicyclopentadiene (70°C at 1 Torr, 0.909 g, 6.87 mmol), and 10% palladium on carbon (0.2 g, predried) were combined in xylene (25 mL) and refluxed 4 hours. The mixture was cooled and additional palladium on carbon (0.3 g) was added. The reaction was refluxed vigorously and xylene was distilled out of the reaction until the volume of the reaction was reduced to about 10 mL. The reaction was refluxed overnight, cooled, and filtered through celite. The filtrate was concentrated on silica gel and flash chromatographed on silica gel. Gradient elution with from 50% to 100% ethyl acetate/hexane gave a forerun containing an unweighed amount of 7-benzamido- $\alpha$ -tetralone. Continued gradient elution with 2% to 10% methanol/ethyl acetate gave 0.49 g (62%) of the title product: mp 172-173.5°C.
- Alternatively, [2,2,2] bicyclooctene was used in place of dicyclopentadiene in the above dehydrogenation reaction to produce the title product in 66% yield after recrystallization from ethyl acetate/hexane.

Example 547-(3-Chlorobenzyloxy)-1-(4-methyl-1-piperazinyl)-naphthalene

A mixture of 3-chlorobenzyl bromide (1.27 g, 6.18 mmol), 7-hydroxy- $\alpha$ -tetralone (1.0 g, 6.17 mmol), and potassium carbonate (1.7 g, 12.3 mmol) in acetone (30 mL) was refluxed overnight. The reaction was cooled, filtered, and concentrated at reduced pressure. The residue was partitioned between ethyl acetate and 1 N sodium hydroxide. The organic phase was washed with water and brine, dried over magnesium sulfate, and concentrated to a yellow solid. Recrystallization from ether/hexane gave 0.87 g (49%) of 7-(3-chlorobenzyloxy)- $\alpha$ -tetralone as a cream colored solid: mp 77-78°C. Analysis calculated for  $C_{17}H_{15}ClO_2$ : C, 71.20; H, 5.27. Found: C, 71.25; H, 5.09.

A solution of 7-(3-chlorobenzyloxy)- $\alpha$ -tetralone (0.8 g, 2.79 mmol) and 1-methylpiperazine (1.0 mL, 4.0 mmol) in dry THF (50 mL) was cooled to -78°C and treated with titanium tetrachloride (0.42 mL, 3.83 mmol) in methylene chloride (2 mL). The reaction was stirred 10 minutes at -78°C, then warmed to room temperature and stirred overnight. The mixture was quenched with 50 mL of 5 N ammonia and extracted with ethyl acetate (2x). This combined organic layer was dried over magnesium sulfate and concentrated to a colorless oil (0.98 g, 95%). This enamine was used directly in the next step.

A mixture of the enamine (1.0 g, 2.71 mmol) and sulfur (1.1 g, 34.31 mmol) in decalin (10 mL) was lowered into an oil bath preheated to 170°C. The mixture was stirred 20 minutes; then it was cooled and the decalin was removed by short path distillation. The residue was dissolved in carbon disulfide and flash chromatographed on silica gel (1 x 6 inches). Elution with carbon disulfide removed residual sulfur. Continued elution with 50% ethyl acetate/hexane and finally with pure ethyl acetate gave 0.09 g of brown oil. The product was combined with 0.03 g of product from a previous preparation and treated with decolorizing carbon in ether. Recrystallization from hexane gave 0.026 g (2.6%) of the title product as a light yellow solid: mp 67.5-68°C. Analysis calculated for  $C_{22}H_{23}ClN_2O$ : C, 72.02; H, 6.32; N, 7.64. Found: C, 71.95; H, 6.32; N, 7.47.

mL). The mixture was stirred overnight at ambient temperature; then it was concentrated at reduced pressure. The residue was partitioned between ethyl acetate and 1 N sodium hydroxide. The organic layer was washed with water and brine; then it was dried over magnesium sulfate and concentrated onto silica gel for flash chromatographic purification (1 x 6 inches). Elution with 75% ethyl acetate/hexane gave 0.24 g (72%) of the title compound as a nearly colorless oil. The oil was treated with HCl in ether to form the hydrochloride salt (0.23 g) which was recrystallized from chloroform/ether to give 0.14 g of a white solid thereof: mp 205-206°C. Analysis calculated for  $C_{23}H_{23}F_3N_2O \cdot HCl \cdot 0.25 H_2O$ : C, 62.58; H, 5.59; N, 6.35. Found: C, 62.59; H, 5.63; N, 6.40.

A mixture of 7-hydroxy-1-(4-methyl-1-piperazinyl)-naphthalene (0.065 g, 0.268 mmol) and benzoyl chloride (0.035 mL, 0.302 mmol) in methylene chloride (1 mL) and saturated sodium bicarbonate (1 mL) was stirred at room temperature. After several hours, a second equivalent of benzoyl chloride was added with continued stirring overnight. The reaction was diluted with ethyl acetate and the phases were separated. The organic layer was washed with 1 N sodium hydroxide, water and brine; then it was dried over magnesium sulfate and concentrated to an oil which solidified (0.065 g, 69%). A sample recrystallized from ether/hexane as a light pink solid was submitted for analysis: mp 82-82.5°C. Analysis calculated for  $C_{22}H_{22}N_2O_2 \cdot 0.25 H_2O$ : C, 75.30; H, 6.46; N, 7.98. ##### 7-(4-Chlorobenzoyloxy)-1-(4-methyl-1-piperazinyl)-naphthalene

The title product was obtained following the procedure of example 30 from 7-hydroxy-1-(4-methyl-1-piperazinyl)-naphthalene (0.065 g, 0.268 mmol) and 4-chlorobenzoyl chloride (0.035 mL, 0.275 mmol) in methylene chloride (1 mL) and saturated sodium bicarbonate (1 mL) with a second equivalent of 4-chlorobenzoyl chloride added after several hours of stirring at room temperature. The title product was obtained in a yield of 0.058 g (57%) after recrystallization from ether/hexane: mp 110-111°C. Analysis calculated for  $C_{22}H_{21}ClN_2O_2$ : C, 69.38; H, 5.56; N, 7.36. Found: C, 69.31; H, 5.61; N, 7.35.

washed with water and brine; then it was dried over magnesium sulfate and concentrated to a pale yellow solid. This material was recrystallized from ether to yield 1.04 g (53%) of 7-(3,4-dichlorobenzyloxy- $\alpha$ -tetralone as a fluffy white solid: mp 122.5-123°C. Analysis calculated for  $C_{17}H_{14}Cl_2O_2$ : C, 63.57; H, 4.39. Found: C, 63.36; H, 4.21.

The product of the above reaction (0.90 g, 2.8 mmol) was combined with N-methylpiperazine (1.0 mL, 9.01 mmol) in dry tetrahydrofuran (THF, 50 mL) and chilled to -78°C. A solution of titanium tetrachloride (0.42 mL, 3.83 mmol) in methylene chloride (2 mL) was added dropwise over 3 minutes resulting in a milky green solution. The reaction was warmed to ambient temperature and stirred overnight; then it was quenched with 50 mL of a 2/1 mixture of water and ammonium hydroxide. The THF was removed with a stream of nitrogen. The residual aqueous phase was extracted with ethyl acetate (2x). The organic extracts were dried over magnesium sulfate and concentrated in vacuo to give 1.08 g (96%) of 7-(3,4-dichlorobenzyloxy-1-(4-methyl-1-piperazinyl)-3,4-dihydronaphthalene as a yellow oil which was suitable for use without further purification.  $^1H$  NMR  $\delta$  7.55 (d,  $J=2$  Hz, 1H), 7.45 (d,  $J=8.2$  Hz, 1H), 7.29-7.25 (m, 1H), 7.07 (d,  $J=8.2$  Hz, 1H), 7.00 (d,  $J=2.7$  Hz, 1H), 6.75 (dd,  $J=2.7, 8.2$  Hz, 1H), 5.30 (t,  $J=4.7$  Hz, 1H), 5.05 (s, 2H), 2.80 (br s, 4H), 2.63-2.43 (m, 6H), 2.36 (s, 3H), 2.30-2.16 (m, 2H).

The product of the above reaction (1.08 g, 2.68 mmol) was combined with 10% palladium on carbon (0.65 g, predried) in dry toluene (30 mL) and refluxed overnight. The reaction was cooled to room temperature and filtered through celite. The pad was rinsed well with ethyl acetate. Concentration yielded a brown oil which was purified by flash chromatography on silica gel (1 x 4 inches). Elution with 75% ethyl acetate/hexane gave an unweighted forerun. Continued elution with ethyl acetate gave 0.22 g of light yellow solid. Recrystallization from ether gave 0.148 g (14%) of the title product as a straw colored solid: mp 113-114°C. Analysis calculated for  $C_{22}H_{22}Cl_2N_2$ : C, 65.84; H, 5.53; N, 6.98. Found: C, 66.18; H, 5.63; N, 7.02.

The product of the above reaction (1.2 g) was combined with 10% palladium on carbon (0.62 g, predried) in dry toluene (50 mL) and refluxed. After several hours of reflux, 0.5 g more catalyst was added and the reaction was further refluxed overnight. The reaction was cooled to room temperature and filtered through celite. The pad was rinsed well with ethyl acetate. Concentration yielded an orange oil which was purified by flash chromatography on silica gel (1 x 4 inches). Elution with 50 % ethyl acetate/hexane gave unweighed recovered starting material. Continued elution as above gave 0.54 g of 7-hydroxy-1-(4-methyl-1-piperaziny)-naphthalene. Further elution with ethyl acetate gave the title product (0.06 g). The title product was recrystallized from ether to afford 0.033 g (2.7%) of light yellow solid: mp 111.5-112°C. The product of the above reaction (1.0 g, 3.49 mmol) was combined with N-methylpiperazine (1.25 mL, 11.27 mmol) in dry tetrahydrofuran (THF, 50 mL) and chilled  
30 to -78°C. A solution of titanium tetrachloride (0.52 mL, 4.74 mmol) in methylene chloride (2 mL) was added dropwise over 3 minutes resulting in a milky green solution. The reaction was warmed to ambient temperature and stirred 2.5 hours; then it was

filtered through celite and concentrated to afford a residue which was used without purification.

The above residue was dissolved in acetic acid (1.5 mL) and diethyl ethoxymethylenemalonate (0.058 mL, 0.29 mmol) was added. The mixture was stirred at 95°C for 2 hours. The mixture was chilled to 0°C and neutralized with 1 N NaOH. The mixture was extracted with methylene chloride and this organic layer was washed with brine, dried through phase separating paper, and concentrated for flash chromatography on silica gel (1 x 2 inches). 50 to 100% ethyl acetate/hexane gradient elution was not productive. Continued elution with 1 and 2% ethanol/ethyl acetate gave an unweighed forerun. Further elution with a gradient of from 4 to 15% ethanol/ethyl acetate gave 0.083 g of a brown oil. ##### 4-Benzyl-2-[-1-(4-methyl-1-piperazinyl)-7-naphthylamino]-thiazole

5 A mixture of the title product of example 23 (0.225 g, 0.75 mmol) and 1-chloro-3-phenylacetone (0.188 g, 1.12 mmol) in isopropanol (6 mL) was refluxed 3 hours. The solvent was removed and the residue was taken up in methylene chloride. The organic phase was washed with saturated aqueous sodium bicarbonate and brine, dried over calcium sulfate, and concentrated onto silica gel for flash chromatography (1 x 3  
10 inches). Gradient elution with 50% to 100% ethyl acetate/hexane gave an unweighed forerun. Continued elution with ethyl acetate gave 0.283 g of a yellow foam. Trituration with ethyl acetate gave 0.137 g (44%) of the title product as yellow crystals: mp 157-160°C. Analysis calculated for  $C_{25}H_{26}N_4S$ : C, 72.43; H, 6.32; N, 13.51. ##### 7-(Benzoylaminothiocarbonylamino)-1-(4-methyl-1-piperazinyl)-naphthalene

To a mixture of ammonium thiocyanate (0.376 g, 4.94 mmol) in acetone (5 mL) was added benzoyl chloride (0.57 mL, 4.94 mmol) dropwise. The mixture (white precipitate) was refluxed 45 minutes which resulted in a yellow heterogeneous solution. A solution of 7-Amino-1-(4-methyl-1-piperazinyl)-naphthalene (1.0 g, 4.14 mmol) in acetone (25 mL) was added dropwise (10 mL acetone rinse also added). The mixture was refluxed 4 hours and allowed to stir overnight at ambient temperature. The mixture was concentrated onto silica gel and flash chromatographed (2 x 3.5 inches). Gradient elution with ethyl acetate/hexane of from 50% to 100% gave an unweighed forerun. Continued gradient elution with 10 to 40% ethanol/ethyl acetate gave 1.3 g (77%) of title product as a yellow foam which was suitable for use without further purification. The compound was found to slowly decompose at room temperature. A sample recrystallized from ethyl acetate/methylene chloride for analysis: mp 160-250°C.  $^1H$  NMR ( $DMSO_{d6}$ ,  $D_2O$ )  $\delta$  8.74 (s, 1H), 7.97 (d,  $J$  = 7.5 Hz, 1H), 7.91 (d,  $J$  = 9 Hz, 1H), 7.70-7.51 (m, 5H), 7.42 (t,  $J$  = 8 Hz, 1H), 7.12 (d,  $J$  = 7 Hz, 1H), 3.11 (m, 4H), 2.79 (br s, 4H), 2.39 (s, 3H). Example 127-(4-Chlorobenzamido-1-(1-piperazinyl)-naphthalene

The title product of example 8 (1.69 g, 4.62 mmol) and 1,8-bis (dimethylamino)naphthalene (3.47 g, 16.2 mmol) were dissolved in dichloroethane (160 mL) and chilled to 0°C. 1-Chloroethyl chloroformate (0.8 mL, 7.4 mmol) was added and the solution was refluxed overnight. The mixture was concentrated and flash chromatographed on silica gel (2 x 3 inches). Elution with 10 to 25% ethyl acetate / hexane gave first an unweighed impurities and then 1.56 g of a mixture of 1,8-bis (dimethylamino)naphthalene and the urethane intermediate (1:1.2 ratio). The mixture was dissolved in methylene chloride and extracted repeatedly with pH 5.8 buffer. The organic layer was dried over calcium sulfate and concentrated to give 0.98g of base free intermediate urethane suitable for subsequent reaction.

The intermediate was dissolved in methanol (40 mL) and refluxed 5 hours. The mixture was concentrated and the residues were taken up in methylene chloride. The organic phase was washed with 0.5 N NaOH and brine, dried over calcium sulfate and concentrated. The residue was flash chromatographed on silica gel (1 x 2 inches). Elution with 5 to 15% methanol/0.1% ammonium hydroxide/ethyl acetate gave 0.667 g of oily solid. This semi-solid recrystallized from methanol to give 0.54 g (32%) of the title compound as tan crystals in two crops: mp 210-211 °C. HRMS m/e calculated for  $C_{21}H_{20}ClN_3O$ : 365.1290. To a cold (-78°C) mixture of lithium aluminum hydride (0.012 g, 0.316 mmol) in THF (5 mL) was added the product of example 5 (0.10 g, 0.256 mmol) all at once. The mixture was allowed to warm to ambient temperature and stir 5 hours. The mixture was refluxed overnight. The mixture was cooled to 0°C and additional lithium aluminum hydride (0.014 g, 0.368 mmol) was added and the mixture was refluxed 5 hours more. The mixture was again cooled to 0°C and carefully quenched with water and the solvent was removed. The residue was taken up in ethyl acetate, dried over sodium sulfate, concentrated, and flash chromatographed on silica gel (1 x 2.5 inches). Elution with a gradient of 50 to 85% ethyl acetate/hexane gave 0.05 g of title product. Recrystallization from ether gave 0.018 g (18.5%) of title product as a white solid: mp 140-141 °C. Example 117-Benzamido-1-(1-piperazinyl)-naphthalene

The title product from Example 1 (0.50 g, 1.45 mmol) was dissolved in methylene chloride (10 mL) and chilled to 0°C. 1-chloroethyl chloroformate (0.156 mL, 1.45 mmol) was added via syringe. The mixture was allowed to come to room temperature and then refluxed 3 hours. Additional 1-chloroethyl chloroformate (0.1 mL, 0.93 mmol) was added and the mixture was further refluxed overnight. Methanol (10mL) was added and the reaction was refluxed for 2 hours. The mixture was concentrated and the residue was taken up in methylene chloride and extracted with 1N NaOH and brine. The organic phase was dried, concentrated onto silica gel, and flash chromatographed (1 x 4 inches silica gel). Gradient elution with ethyl acetate / hexane of from 1:1 to 100% ethyl acetate followed by elution with 2 to 10 % ethanol/0.1 % ammonium hydroxide/ethyl acetate gave recovered unweighed starting material. Continued elution with 15% methanol / 0.1% ammonium hydroxide/ethyl acetate gave 0.32 g of the title product as a clear colorless oil which partially crystallized on standing. Example 37-(2-Naphthylcarboxamido)-1-(4-methyl-1-piperazinyl)-naphthalene

A solution of 7-amino-1-(4-methyl-1-piperazinyl)-naphthalene (0.197 g, 0.817 mmol) and triethylamine (0.217 mL, 1.63 mmol) in acetonitrile (10 mL) was chilled to 0°C and 2-naphthoyl chloride (0.311 g, 1.63 mmol) was added. The solution was refluxed overnight. The solvent was removed at reduced pressure and the residue was taken up in methylene chloride. The mixture was stirred vigorously with saturated sodium bicarbonate for 2 hours and the phases were separated. The organic layer was dried over calcium sulfate and concentrated to a tan foam which was purified by flash chromatography on silica gel (1 x 3 inches). Ethyl acetate/hexane gradient elution of from 25:75 to 75:25 followed by ethyl acetate and finally 5% ethanol/ethyl acetate gave 0.31 g of light yellow foam. Trituration with hexane yielded 0.235 g (72%) of the title product as an amorphous solid: mp 95-130°C. Example 17-Benzamido-1-(4-methyl-1-piperazinyl)-naphthalene

7-Amino- $\alpha$ -tetralone (42.15 g, 0.262 mol) was dissolved in dry THF (1000 mL) and triethylamine (38.3 mL, 0.288 mol) was added. The mixture was chilled to 0°C and  
5 benzoyl chloride (33.4 mL, 0.288 mol) was added dropwise with a THF (10 mL) rinse. The mixture was mechanically stirred overnight, then the solvent was removed with a nitrogen stream. The residues were taken up in methylene chloride and extracted with 1N HCl, water, saturated sodium bicarbonate, and brine. The organic phase was further dried over calcium sulfate and concentrated to a solid mass. Recrystallization  
10 from ethanol (650 mL) yielded 52 g of 7-benzamido- $\alpha$ -tetralone. Concentration of the mother liquors yielded another 6 g for a total yield of 58.9 g (85%): mp 153-156°C. 7-Benzamido- $\alpha$ -tetralone (5.0 g, 18.95 mmol) was dissolved in dry THF (107 mL)  
15 and N-methyl-piperazine (6.3 mL, 56.8 mmol) was added. The solution was cooled to -78°C and titanium tetrachloride (2.5 mL, 22.75 mmol) in methylene chloride (30 mL) was added dropwise. The mixture was stirred overnight and during this time a fine green precipitate formed. The solvent was removed under a stream of nitrogen and the residue was stirred vigorously in a mixture of ethyl acetate and 5N ammonium  
20 hydroxide for 2 hours. The solid which formed was collected, washed with ethyl acetate and then ether, and dried in vacuo. The filtrate was discarded. The solid was vigorously stirred with 1N sodium hydroxide (100 mL) and methylene chloride (100 mL) for 2 hours. The solid which did not dissolve was removed by filtration. The phases were separated from the filtrate and the organic layer was washed with brine, dried over  
25 calcium sulfate and concentrated to give 1.01 g of product. The solid was now stirred with dimethyl sulfoxide (DMSO, 150 mL) for 2 hours and filtered again. The undissolved material was discarded. The DMSO was removed at reduced pressure and the residue was taken up in methylene chloride. This organic solution was treated with brine which removed the last traces of DMSO from the organic phase and caused immediate  
30 precipitation of 2.29 g more product which was collected and dried. The phases were separated from the filtrate. The organic layer was dried over sodium sulfate and concentrated to leave 2.13 g of light tan solid product. In this fashion 5.43 g, 83% of 7-benzamido-1-(4-methyl-1-piperazinyl)-3,4-dihydronaphthalene was obtained; <sup>1</sup>H NMR

The product from the above reaction and ethoxymethylenemalononitrile (0.079 g, 0.646 mmol) were combined in glacial acetic acid (7 mL) were refluxed 4 hours. The solvent was removed at reduced pressure and the residue was taken up in methylene chloride. The organic phase was washed with 1 N sodium hydroxide and brine, then it was dried and concentrated. This residue was flash chromatographed on silica gel (1 x 3.5 inches). Gradient elution with from 50% ethyl acetate / hexane to pure ethyl acetate and then with from 2% to 5% methanol / ethyl acetate gave no product. Continued elution with from 15% to 40% methanol / ethyl acetate gave a tan foam product. Treatment with charcoal in methylene chloride, filtration and concentration gave 0.155 g of product. Recrystallization from ethyl acetate gave 0.04 g (23%) of the title compound as off white crystals. mp 118-120°C. Example 617-Amino-1-(1-methyl-3-piperidiny)-naphthalene

A solution of 8-bromo-2-(dibenzylamino)-naphthalene (9.75 g, 24.3 mmol product of Preparation 4) in tetrahydrofuran (270 mL) was cooled to -78°C and butyllithium (9.72 mL, 24.4 mmol, 2.4 M) was added dropwise. The orange solution was stirred 20 minutes, then 1-t-butoxycarbonyl-3-piperidone (4.84 g, 24.3 mmol dissolved in 5 mL tetrahydrofuran ) was added dropwise with a 5 mL tetrahydrofuran rinse. The reaction was stirred 30 minutes at -78°C, then allowed to warm to room temperature and stir 1 hour. The solvent was removed and the residue was partitioned between methylen chloride and water. The phases were separated and the organic layer was washed with brine, dried over calcium sulfate, and concentrated onto silica gel. Flash chromatography (3 x 3 inches silica gel) proceeded as follows: 5% ethyl acetate / hexane (1.4 L) and 10% ethyl acetate / hexane (1 L) unweighed white solid 7-dibenzylaminonaphthalene; 25%ethyl acetate / hexane (1.5 L) 6.46 g (51%) of 7-dibenzylamino-1-(1-t-butoxycarbonyl-3-hydroxy-3-piperidiny)-na phthalene which was suitable for use without further purification. A sample recrystallized from ethyl acetate / hexane had mp 145-147°C.

The product of the above reaction (1.0 g, 1.9 mmol) and dry benzene (20 mL) were chilled to 0°C and Burgess salt (0.958 g, 4.02 mmol) was added. The mixture was heated to 55°C for 2 hours, then allowed to stir at ambient temperature overnight. Water was added and after stirring an additional 15 minutes, the phases were separated. The organic layer was washed with brine and the combined aqueous washes were back extracted with ethyl acetate. The combined organic layer was dried over calcium sulfate, concentrated onto silica gel and flash chromatographed (1 x 3

inches). Elution 2% to 4% ethyl acetate / hexane gave 0.68 g (70%) of a mixture of both possible dehydration products (7-dibenzylamino-1-(1-t-butoxycarbonyl-1,4,5,6-tetrahydropyrid-3-yl)-naphthalene and 7-dibenzylamino-1-(1-t-butoxycarbonyl-1,2,5,6-tetrahydropyrid-3-yl)-naphthalene). The products could be separated by careful chromatography but were carried as a mixture in this sequence.

A slurry of lithium aluminum hydride (0.172 g, 4.52 mmol) in tetrahydrofuran (20 mL) was chilled to 0°C and the product of the above reaction (0.568 g, 1.13 mmol in 5 mL tetrahydrofuran) was added with a tetrahydrofuran rinse (2 x 2.5 mL). The mixture was refluxed 4 hours, chilled to 0°C and quenched with sodium sulfate decahydrate. The reaction was filtered and the filter cake was rinsed well with methylene chloride. The filtrate was concentrated and the residue was taken up in methylene chloride. This organic phase was washed with water and brine, dried and concentrated to give 0.455 g of a 2:1 mixture of olefin products (7-dibenzylamino-1-(1-methyl-1,4,5,6-tetrahydropyrid-3-yl)-naphthalene and 7-dibenzylamino-1-(1-methyl-1,2,5,6-tetrahydropyrid-3-yl)-naphthalene) as judged by integration of the methyl signals in the NMR spectrum (2.52 ppm - major and 2.27 ppm - minor). This material was carried on without further purification or characterization.

The product mixture from the above reaction (4.0 g, 9.56 mmol) and palladium hydroxide (20% on carbon, 3.75 g) in glacial acetic acid (141 mL) and ethanol (141 mL) was hydrogenated 4 hours (starting pressure approximately 50 psi). Additional palladium hydroxide (0.8 g) was added and hydrogenation was continued 5 hours more. The reaction was filtered through celite. The filtrate was neutralized with 4 N sodium hydroxide and extracted with methylene chloride. This organic phase was washed with brine, dried, concentrated onto silica gel and flash chromatographed (2 x 3 inches). Elution proceeded as follows: 75% ethyl acetate / hexane (400 mL), ethyl acetate (400 mL), and 2% methanol / ethyl acetate (400 mL), nil; 2% triethylamine / 5% methanol / ethyl acetate (400 mL), 0.45 g of an unidentified brown foam; 2% triethylamine / 6% methanol / ethyl acetate (500 mL) and 3% triethylamine / 8% methanol / ethyl acetate (500 mL), 1.35 g (54%) of brown foam title product. Further purification by treatment with activated charcoal followed by trituration in ether gave 0.362 g of the title compound as pink crystals which had mp 117-120°C. HRMS m/e calculated for  $C_{16}H_{20}N_2$ : 240.1622. Observed m/e 240.1623. Analysis calculated for  $C_{16}H_{20}N_2$ : C, 79.96; H, 8.39; N, 11.66. Found: C, 80.02; H, 8.22; N, 11.10.

A solution of 7-dibenzylamino-1-(1-t-butoxycarbonyl-3-hydroxy-3-pyrrolidinylnaphthalene (1.0 g, 1.97 mmol) in benzene (20 mL) was chilled on wet ice (precipitate) and Burgess salt (0.89 g, 3.74 mol) was added all at once. The mixture was heated to 55°C for 2 hours. The reaction was cooled and extracted with water and brine. The combined aqueous phase was back extracted with ethyl acetate and the combined organic layer was dried over calcium sulfate. The organic layer was concentrated onto silica gel and flash chromatographed (1 x 2.5 inches). Elution with 5% ethyl acetate / hexane (1300 mL) gave 0.764 g (79%) of a brown solid which was a mixture of two dehydration products which were used directly in the next reaction.

A slurry of lithium aluminum hydride (1.78 g, 46.92 mmol) in tetrahydrofuran (220 mL) was chilled to 0°C and the product of the above reaction (5.75 g, 11.73 mmol) was added in tetrahydrofuran (10 mL with 2 x 10 mL rinses). The mixture was refluxed 5 hours, chilled to 0°C and carefully quenched with sodium sulfate decahydrate. The reaction was filtered and the filter cake was rinsed well with methylene chloride. The filtrate was concentrated at reduced pressure and the residue was taken up in methylene chloride. The organic phase was washed with brine, dried, and concentrated to give 4.58 g of a brown oil which was a 2:1 mixture of olefinic products as judged by integration of the methyl singlet at 2.48 ppm (major) and 2.31 ppm (minor) from the NMR spectrum. The mixture was used directly in the next step.

A mixture of the product of the above reaction (4.58 g) and 20% palladium hydroxide on carbon (4.7 g) in ethanol (161 mL) and acetic acid (161 mL) was hydrogenated at about 50 psi for 5.5 hours. The reaction was filtered through celite and the filtrate was concentrated at reduced pressure. The residue was neutralized with 4 N sodium hydroxide and extracted with methylene chloride. The organic phase was washed with brine, dried over calcium sulfate, concentrated onto silica gel and flash chromatographed (2 x 3.25 inches). Elution proceeded as follows: ethyl acetate (200 mL), nil; 1% triethylamine / 1% methanol / ethyl acetate (500 mL) and 2% triethylamine / 2% methanol / ethyl acetate (500 mL), nil; 5% triethylamine / 5% methanol / ethyl acetate (500 mL) and 10% triethylamine / 10% methanol / ethyl acetate (400 mL), 0.90 g of the title compound as a brown oil.  $^1\text{H}$  NMR  $\delta$  7.66 (d,  $J = 8.5$  Hz, 1 H), 7.56 (d,

Aqueous ammonium chloride and ether were added and the phases were separated. The organic layer was washed with water and brine, dried over magnesium sulfate, concentrated onto silica gel and flash chromatographed (2 x 6 inches). Elution proceeded as follows: 2% ether / hexane (1 L), unweighed impurity; 5% ether / hexane (1000 mL), 10% ether / hexane (1000 mL), and 20% ether / hexane (1000 mL), 5.74 g (78%) of the xanthate intermediate as a mixture of diastereomers which was used directly in the next step.

A solution of the xanthate from the above reaction (5.74 g, 9.37 mmol) in toluene (300 mL) was heated to reflux and AIBN (0.26 g) (AIBN=azo(bis) isobutyronitrile) and tributyltin hydride (11.7 mL, 43.5 mmol) were added in three portions first at initial reflux and then after 1 and 2 hours of reflux. The reaction was refluxed an additional 1.5 hours, cooled to room temperature and allowed to stir overnight. The reaction was concentrated onto silica gel and flash chromatographed (2 x 8 inches). Elution proceeded as follows: hexane (1000 mL), unweighed tin impurities; 2% ether / hexane (2 L) and 3% ether / hexane (2 L), unweighed impurities; 5% ether / hexane (3 L), 3.07 g (65%) of 7-dibenzylamino-1-(1-t-butoxycarbonyl-pyrrolidin-2-(R)-ylmethyl)- naphthalene as a hard yellow-green foam.

A mixture of 7-dibenzylamino-1-(1-t-butoxycarbonyl-pyrrolidin-2-(R)-ylmethyl)- naphthalene (0.68 g, 1.34 mmol) and 20% palladium hydroxide on carbon (0.25 g) in ethanol (20 mL) and acetic acid (20 mL) was hydrogenated at 50 psi for 8 hours. Additional 20% palladium hydroxide on carbon (0.25 g) was added and hydrogenation was continued overnight. The catalyst (0.3 g) was added a third time and hydrogenation was continued 24 hours more. The reaction was filtered through celite and the pad was washed with ethanol. The filtrate was concentrated and the residue was taken up in ether. This organic phase was extracted with saturated aqueous sodium bicarbonate, water and brine, then it was dried and concentrated to give 0.368 g (84%) of the title compound as a tan foam. Elution proceeded as follows: 10% ethyl acetate / hexane (700 mL), 1.62g of 7-tert-butoxycarbonylamino-1-(4-tert-butoxycarbonyl-1-piperaziny)-naphthalene as a yellow foam; 10% ethyl acetate / hexane (200 mL) and 30% ethyl acetate / hexane

(500 mL), 4.18 g of 7-amino-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene as a brown foam which had  $^1\text{H}$  NMR  $\delta$  7.67 (d,  $J$  = 8.5 Hz, 1 H), 7.46 (d,  $J$  = 8 Hz, 1 H), 7.35 (d,  $J$  = 2.5 Hz, 1 H), 7.17 (t,  $J$  = 7.5 Hz, 1 H), 7.01 (dd,  $J$  = 1, 7.5 Hz, 1 H), 6.95 (dd,  $J$  = 2.5, 8.5 Hz, 1 H), 3.90 (br s, 2 H), 3.05 (br s, 8 H), 1.51 (s, 9 H).

5 A mixture of 7-amino-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene (0.523 g, 1.60 mmol, product of the above reaction), 2-chloro-3-nitropyridine-N-oxide (0.335 g, 1.92 mmol, product of preparation 5) and 4-dimethylaminopyridine (0.195 g, 1.60 mmol) in ethanol (40 mL) was refluxed 2 hours. The solvent was removed at reduced pressure and the residue was taken up in methylene chloride. The organic solution  
10 was washed with saturated aqueous sodium bicarbonate and brine and the aqueous washes were back extracted (5x) with methylene chloride. The combined organic phase was dried, concentrated onto silica gel and flash chromatographed (1 x 3 inches). Elution proceeded as follows: 50% ethyl acetate / hexane (200 mL) and 75% ethyl acetate / hexane (200 mL), nil; 70% ethyl acetate / hexane (100 mL) and ethyl  
15 acetate (300 mL), 0.458 g (61%) of 7-(3-nitro-1-oxido-2-pyridylamino)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene as a dark red foam which was suitable for use without further purification. 20 A mixture of 7-(3-nitro-1-oxido-2-pyridylamino)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene (0.40 g, 0.86 mmol, product of the above reaction), ammonium formate (1.0 g, 17.2 mmol), and 10% palladium on carbon (0.15 g) in ethanol (30 mL) was refluxed 4 hour while continually returning sublimed ammonium formate back into the reaction. The solvent was removed at reduced pressure and the residue was taken  
25 up in methylene chloride. The organic solution was washed with water and brine, dried over calcium sulfate, and concentrated. The residue was flash chromatographed on silica gel (1 x 3 inches). Elution proceeded as follows: 25% ethyl acetate / hexane (100 mL), nil; 35% ethyl acetate / hexane (250 mL), 0.25 g of product. The product was treated with activated carbon, filtered, and concentrated. The residue was recrystallized  
30 from ethyl acetate / ether to give 0.11 g (30%) of 7-(3-amino-2-pyridylamino)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene as white crystals which were sensitive to air (turn brown on air exposure) and had mp 183-184°C. Analysis calculated for  $\text{C}_{24}\text{H}_{29}\text{N}_5\text{O}_2$ : C, 68.71; H, 6.97; N, 16.69. Found: C, 68.76; H, 6.58; N, 16.56.

A mixture of 7-(3-amino-2-pyridylamino)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene (0.124 g, 0.296 mmol, product of the above reaction) and ethoxymethylenemalononitrile (0.47 g, 0.385 mmol) in isopropanol (7 mL) was refluxed 4 hour. Additional ethoxymethylenemalononitrile (0.035 g) was added and the reaction was refluxed overnight. The reaction was concentrated onto silica gel and flash chromatographed (1 x 3.5 inches). Elution proceeded as follows: 10% ethyl acetate / hexane (400 mL), nil; 20% ethyl acetate / hexane (300 mL), unweighed isopropoxymethylenemalononitrile; 20% ethyl acetate / hexane (50 mL) and 40% ethyl acetate / hexane (300 mL), 0.082 g (65%) of 7-(imidazo-[4,5-b]-pyridin-1-yl)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene as a tan oily foam which was suitable for use as obtained which had <sup>1</sup>H NMR  $\delta$  8.76 (d, J = 2 Hz, 1 H), 8.51-8.48 (m, 2 H), 8.20 (dd, J = 1.5, 8 Hz, 1 H), 8.04 (d, J = 9 Hz, 1 H), 7.84 (dd, J = 5, 8 Hz, 1 H), 7.65 (d, J = 8 Hz, 1 H), 7.49 (t, J = 8 Hz, 1 H), 7.36 (dd, J = 5, 8 Hz, 1 H), 7.17 (d, J = 7.5 Hz, 1 H), 4.20-3.30 (br coalesced signal, 4 H), 3.16 (br s, 4 H), 1.51 (s, 9 H).

A solution of 7-(imidazo-[4,5-b]-pyridin-1-yl)-1-(4-tert-butoxycarbonyl-1-piperazinyl)-naphthalene (0.076 g, 0.177 mmol) in ethanol (6 mL) was treated with hydrogen chloride saturated dioxane (4 mL). The mixture was stirred 10 hours at room temperature and a fine precipitate formed. The solvent was removed at reduced pressure and the residue was dissolved in hot methanol and filtered. The filtrate was concentrated to about 4 mL at the boil and treated with ethanol (3 mL). The white crystals obtained on cooling were collected and washed with cold ethanol to give 0.022 g (33%) of the dihydrochloride of the title compound. mp >250°C. ##### 15 General procedure for the synthesis of (1-piperazinyl)naphthyl-7-yl ethers.

To a flame dried round bottom flask was added 7-hydroxy-1-(4-methyl-1-piperazinyl)naphthalene (0.30 g, 1.23 mmol), anhydrous N,N-dimethylformamide (3 mL), and 60% dispersion of sodium hydride in mineral oil (0.060 g; 1.47 mmol, 1.2 eq). The resulting suspension was heated for twenty minutes at 40°C, and the resulting reaction  
20 mixture was then allowed to cool to room temperature. A suspension of the appropriate alkylating agent or appropriate electrophile (1.35 mmol, 1.1 eq), anhydrous DMF (1 mL) and 60% sodium hydride (0.075 grams 0.00183 moles) was then added slowly over 30 minutes in three portions to the reaction mixture, and the resulting mixture was heated at 80°C. The progress of the reaction was monitored by TLC, and reaction completion  
25 was determined by consumption of 7-hydroxy-1-(4-methyl-1-piperazinyl)naphthalene as determined by TLC. Upon determination of reaction completion, DMF was then removed in vacuo, and the residue was partitioned between methylene chloride (40 mL) and saturated sodium bicarbonate solution (40 mL). The organic layer was removed, dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated in vacuo. The resulting residue was purified by flash  
30 column chromatography using silica gel (15 grams) and elution with 12:1:0.04 [ $\text{CH}_2\text{Cl}_2$ : methanol:  $\text{NH}_4\text{OH}$ ] to afford the title compound.

Using the above general procedure, the following compounds were prepared:

A. 2-[8-(Methylpiperazin-1-yl)naphthalen-2-yloxy]nicotinonitrile

2-Chloro-3-cyanopyridine was the electrophile. Chromatography afforded the title compound (33%) as an amorphous solid: HRMS m/e calculated for  $C_{21}H_{20}N_4O$  344.1637. 8-(4-Methylpiperazin-1-yl)naphthalene-2-carboxylic acid phenylamide

To a flame dried 3-neck flask were added 7-trifluoromethylsulfonyloxy-1-(4-methylpiperazin-1-yl)naphthalene (0.95g, 2.54 mmol), aniline (0.35 mL, 3.81 mmol), and triethylamine (0.39 mL, 2.79 mmol). A balloon of carbon monoxide provided a CO atmosphere above the reaction mixture via the reflux condenser. The reaction contents were heated at 100°C for ten minutes. The solution was then cooled to 70°C, and bis(triphenylphosphine)palladium(II) chloride (0.036 g, .05 mmol, 2 mol%) was added to the reaction solution. The resulting reaction mixture was stirred at 100°C for 19 hours. Then the CO balloon was refilled with CO, additional triethylamine (approx. 0.5 mL) was added, and this mixture was stirred at 100°C for 5 hours. Ethyl acetate (25 mL) was added to the cooled reaction mixture, and this mixture was then filtered through Celite®. The filtrate was concentrated in vacuo. The residue was purified using flash column chromatography using silica gel (30 g) and elution with 5% methanol in ethyl acetate to afford the title compound (0.090 g, 10%) as an amorphous solid:  $R_f$  = 0.42 in 9:1:0.1 methylene chloride/methanol/ammonium hydroxide; HRMS m/e calculated for  $C_{22}H_{23}N_3O$  345.1843. A mixture of 3-methoxy-1-bromobenzene (0.089 mL, 0.71 mmol), 7-trimethylstannyl-1-(4-methylpiperazin-1-yl)naphthalene (0.25 g, 0.64 mmol), bis-  
 5 (acetonitrile) palladium chloride (0.0085 g, 0.032 mmol), tri(3-methoxyphenyl)phosphine (0.023 g, 0.064 mmol), and butylated hydroxytoluene (BHT, about 0.001 g, antioxidant) in dimethyl formamide (12 mL) was warmed to 110°C for 2 hours. The reaction was cooled to room temperature and diluted with 1 N aqueous lithium chloride (25 mL) and 1 N sodium hydroxide (2 mL); then extracted with ether (3X). The combined ether layer  
 10 was washed with 1N aqueous lithium chloride and brine. The organic phase was dried over calcium sulfate and concentrated. The residue was purified by flash chromatography on silica gel (1x2.5 inches). Elution proceeded as follows: 75% ethyl acetate / hexane, 200 mL, nil; 2% methanol / ethyl acetate 200 mL and 10% methanol / ethyl acetate, 200 mL, 0.084 g of an oil. This oil was further purified by kugelrohr

#### Preparation 1

##### 7-hydroxy-1-(4-methyl-1-piperazinyl)-3,4-dihydronaphthalene

- 7-Hydroxy-*α*-tetralone (1.0 g, 6.17 mmol, Corey and Estreicher, Tetrahedron Lett., 1981, 22, 603) and 1-methylpiperazine (2.2 mL, 19.83 mmol) were dissolved in dry THF (90 mL) and chilled to 0°C. Titanium tetrachloride (0.91 mL, 8.3 mmol) was allowed to run down the side of the reaction vessel into the reaction via syringe to give a vigorous reaction which caused the solution to turn orange-red. The mixture was allowed to warm to ambient temperature and stir 1.5 hours. A 2:1 mixture of water and concentrated ammonium hydroxide (90 mL) was added and the mixture was extracted with ethyl acetate. The organic phase was dried over calcium sulfate and concentrated to give 1.48 g of crude enamine which was used immediately without characterization. (This enamine was not stable to chromatography but did show a characteristic signal in the <sup>1</sup>H NMR for the enamine vinyl proton at 5.28 ppm with a 4.7 Hz coupling constant).

##### 7-Hydroxy-1-(4-methyl-1-piperazinyl)-naphthalene

10% Palladium on carbon (1.16 g) and 7-hydroxy-1-(4-methyl-1-piperazinyl)-2,3-dihydronaphthalene (1.48 g, 6.06 mmol) were slurried in toluene (100 mL) and refluxed 16.5 h. The mixture was cooled, filtered, and concentrated. The product was purified

by flash chromatography on silica gel (1 x 6 inches). Elution with 50 % ethyl acetate/hexane followed by 100% ethyl acetate gave 0.51 g (34%) of the title product as a light pink foam. A sample was recrystallized from ether to give a cream colored solid for analysis: mp 184-185°C. Analysis calculated for  $C_{15}H_{19}N_2O$ : C, 74.35; H, 7.49; N, 11.56. Found: C, 74.05; H, 7.03; N, 11.42.

### Preparation 3

#### 7-Trimethylstannyl-1-(4-methyl-1-piperazinyl)-naphthalene

7-trifluoromethylsulfonyloxy-1-(4-methyl-1-piperazinyl)-naphthalene (2.0 g, 5.34 mmol), hexamethylditin (1.92 g, 5.86 mmol), lithium chloride (0.68 g, 16 mmol), tetra (triphenylphosphine) palladium (0.24 g, 0.21 mmol) and butylated hydroxytoluene (a few crystals, antioxidant) were combined in dry dioxane (50 mL) and refluxed 45 minutes. The mixture was cooled and quenched with saturated ammonium chloride (50 mL). The mixture was extracted with ether (2x) and the combined organic phase was washed with brine, dried over magnesium sulfate, and concentrated to a brown oil. Flash chromatography on silica gel (2 x 4 inches) with 50% ethyl acetate/hexane elution gave 0.77 g (37%) of the title product as a light brown oil which slowly solidified. The product was suitable for use in subsequent reactions but was not analytically pure:  $^1H$  NMR  $\delta$  8.36 (s with Sn coupling, 1H), 7.80 (d,  $J = 8$  Hz, 1H), 7.61-7.51 (m, 2H), 7.40 (t,  $J = 8$  Hz, 1H), 7.09 (dd,  $J = 1, 7.5$  Hz, 1H), 3.2 (br s, 4H), 2.75 (br s, 4H), 2.46 (s, 3H), 0.39 (s with Sn coupling of 55.0 and 52.5 Hz, 9H).

### Preparation 4

#### 8-Bromo-2-(dibenzylamino)-naphthalene

A mixture of dibenzylamine (70.8 mL, 0.368 mol), 8-bromo-2-tetralone (82.86 g, 0.368 mol, U. S. patent 4,897,405 A), dry toluene (1000 mL), and p-toluenesulfonic acid (0.83 g, 4.36 mmol) was refluxed 2 days with azeotropic removal of water. Most of the toluene was distilled away from the reaction and the residual material was dried in vacuo about 12 hours. The crude enamine was obtained as an orange oil and was used directly in the next step.  $^1H$  NMR  $\delta$  7.41-7.17 (m, 13 H), 6.97 (d,  $J = 7.3$  Hz, 1 H), 6.72 (t,  $J = 7.6$  Hz, 1 H), 5.83 (s, 1 H), 4.54 (s, 4 H), 2.86 (t,  $J = 7.8$  Hz, 2 H), 2.55 (dd,  $J = 8.5, 6.6$  Hz, 2 H).

The enamine from the above reaction was dissolved in tetrahydrofuran (2000 mL) and chilled to 0°C. Chloranil (90.48 g, 0.368 mol) was added in portions over 10 minutes. The black solution was stirred 1.45 hours at 0°C, then the solvent was

-76-

removed at reduced pressure. The residue was taken up in methylene chloride (750 mL) and filtered through celite to remove an insoluble yellow material (discarded). Saturated sodium carbonate (500 mL) was added to the filtrate and the two phase mixture was vigorously stirred 15 minutes. The mixture was again filtered through celite to remove a greenish solid (discarded). The phases were separated from the filtrate and the organic layer was washed with saturated sodium carbonate and then brine. The solution was dried over calcium sulfate and concentrated onto silica gel and applied to a flash chromatography column (4 x 4 inches silica gel). Elution proceeded as follows: hexane (500 mL, nil); 5% ether / hexane (2 L, nil); 5% ether / hexane (12 L, unweighed orange oil product). The oil was triturated with 50% ether:hexane (500 mL) to yield the tan product, 8-bromo-2-(dibenzylamino)-naphthalene (72.15 g). The residues from the trituration were rechromatographed as above to afford an additional 18.95 g of product. The combined yield was 91.1 g, 61%. mp 102.5-103°C; <sup>1</sup>H NMR δ 7.64-7.60 (m, 3 H), 7.37-7.24 (m, 11 H), 7.13 (dd, J = 9, 2.5 Hz, 1 H), 7.00 (t, J = 7.8 Hz, 1 H), 4.80 (s, 4 H). Analysis calculated for C<sub>24</sub>H<sub>20</sub>BrN: C, 71.65; H, 5.01; N, 3.48. Found: C, 71.24; H, 4.65; N, 3.49.

#### Preparation 5

##### 2-Chloro-3-nitropyridine-N-oxide

2-Chloro-3-nitropyridine (0.69 g, 4.35 mmol) was chilled to 0°C and trifluoroacetic acid (9 mL) was slowly added followed by 30% hydrogen peroxide (1 mL). The solution was warmed to 70°C for 1.5 hours, cooled to 0°C and excess peroxide was decomposed by dropwise addition of dimethylsulfide (1 mL) and stirring 0.5 hours. The reaction was concentrated at reduced pressure onto silica gel and flash chromatographed (1 x 3 inches). Elution proceeded as follows: 50% ethyl acetate / hexane (175 mL), nil; 75% ethyl acetate / hexane (175 mL), 0.589 g (77%) of 2-chloro-3-nitropyridine-N-oxide as an orange solid suitable for use without further purification. A sample recrystallized from ethyl acetate / hexane had mp 98-100°C. Analysis calculated for C<sub>5</sub>H<sub>3</sub>ClN<sub>2</sub>O<sub>3</sub>: C, 34.41; H, 1.73; N, 16.05. Found: C, 34.75; H, 1.67; N, 15.80.

Preparation 6

5-Trimethylstannylpyrimidine

A mixture of 5-bromopyrimidine (4.00 g, 25.16 mmol), hexamethylditin (9.06 g, 27.67 mmol), lithium chloride (1.27 g, 30.19 mmol), tetrakis(triphenylphosphine) palladium (1.13 g, 0.981 mmol), 2,6-di-tert-butyl-4-methylphenol (approximately 0.01 g), and dioxane (45 mL) was heated at reflux under nitrogen for 7 hours. The resulting mixture was concentrated via evaporation under reduced pressure, and the residue was column chromatographed using silica gel (approximately 200 g) and elution with ethyl acetate/hexanes [1:1] to afford the title compound (4.75 g, 19.6 mmol, 78%) as a clear, colorless liquid;  $R_f$  = 0.6 in ethyl acetate/hexanes [1:1];  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  9.11 (s, 1H), 8.70 (s, 2H), 0.38 (s, 9H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  162.8, 158.5, 134.4, -9.6.

Preparation 7

5-Cyano-3-trimethylstannylpyridine

A mixture of 3-bromo-5-cyanopyridine (5.84 g, 31.91 mmol), hexamethylditin (11.49 g, 35.10 mmol), lithium chloride (1.62 g, 38.29 mmol), tetrakis(triphenylphosphine)palladium (1.44 g, 1.24 mmol), 2,6-di-tert-butyl-4-methylphenol (approximately 0.01 g), and dioxane (60 mL) was heated at reflux under nitrogen for 8 hours. The resulting mixture was concentrated via evaporation under reduced pressure, and the residue was column chromatographed using silica gel (approximately 200 g) and elution with ether/hexanes [1:1] to afford the title compound (1.98 g, 7.41 mmol, 23%) as a pale yellow solid; mp, 77.0-79.0°C;  $R_f$  = 0.65 in ether/hexanes [1:1];  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  8.80 (dd,  $J$ =1.5 and 2.4 Hz, 2H), 8.03 (dd,  $J$ =1.5 and 2.1 Hz, 1H), 0.39 (s, 9H).

The compounds of formula I of the present invention described in the above Examples were assayed for 5-HT<sub>1A</sub> and 5-HT<sub>1D</sub> affinity using the aforementioned procedures with IC<sub>50</sub>s of less than 0.60  $\mu\text{M}$  for at least one of the above affinities.
